

FEATURES

Growing your own fruit is a healthy, safe, and cost-saving option that is as easy and available as growing the plant that is bearing this tag. Planting fruit is a way to improve your property through beautiful edible landscaping and sustainable organic fruit production for your health and enjoyment, year after year.

PLANTING

Fruiting plants will produce every year in a sunny well-drained site, and provide nutritious organic antioxidants. They require little care, and are seldom bothered by pests. Fruiting plants will be most abundant when placed near other fruiting plants to attract as many pollinators to their flowers as possible. You can improve your soil to provide extra nutrients during planting if you dig your hole twice as wide as the underground portion of the plant and add any of these common amendments: **For Blueberries add peat moss, pine bark mulch, coffee grounds, or leaf compost. Raspberries, Blackberries and Grapes prefer a neutral soil similar to your vegetable garden and will thrive on a fence, stake, or trellis to climb above ground.**

HARVEST

Pick and eat your fresh delicious fruit, or freeze your harvest until it can be enjoyed at a later date! Spread it out and let it dry slightly before freezing so it does not stick together. Then remove from the freezer and wash just before using...You can have the exact amount you need, any time you want, in all of your favorite snacks, meals, and recipes!
